This sheet provides some common risks in student projects. You should check if it applies to your group project.
You should also feel free to add other risks. Exemplary analysis is also added.

Risk Category	Risk Title	Description	#	Estimated likelihood of occurrence	Estimated Impact (I:1-5 with 1
Personel	Loss team members	One or more team members drop the class		1	4
	add new team members	A new member joins the team mid-project and needs to ramp up.		2	2
	Lack of motivation or responsibility	A member disengages or misses assigned tasks.		2	3
Communication	duplicate work	Two members unknowingly build the same feature.		3	2
	worked on wrong components	A member builds a component that doesn't match agreed requirements.		2	3
	useless work	Work is done on something that turns out not to be needed.		2	2
	inconsistent work	Code across the app is written with inconsistent style/assumptions.		3	2
Requirements	unclear requirements	A user story is ambiguous, leading to rework.		3	3
	scope creep	New requirements are added mid-iteration beyond what was committed.		3	3

	constant requirements changes	Requirements change repeatedly across iterations, causing rework.	2	3
Management	improper task assignments	Tasks are assigned to members without the right skills/bandwidth.	2	3
	improper planning	Sprint plans underestimate effort or dependencies.	2	3
	lack of management s	The iteration's team lead lacks experience coordinating the team.	2	2
Technology competence	Not familiar with the framework used	A member is unfamiliar with React/Express or another core framework.	3	2
	Not familiar with the programming language used	A member is new to JavaScript/Node.js.	2	2
	Not familiar with unit testing	Members lack experience writing unit tests.	3	3
	Other technology incompetence	A gap with another required tool (Docker, CI/CD, hosting) slows the team.	2	2
	Not familiar with Git	A member is inexperienced with Git/GitHub workflows.	3	2
Design and implementation	Improper design	The architecture or data model doesn't hold up under real requirements.	2	4

	improper technology stack	A chosen library/tool in the stack turns out to be a poor fit.	2	3
	Messy code	Inconsistent or poorly structured code accumulates over time.	3	2
Testing	Not enough testing	Limited time/experience leads to insufficient automated test coverage.	3	4
Integration and deployment	Not enough time for integration and deployment	Integration/deployment is left too late, risking a rushed final demo.	3	4

#	Estimated retirement Cost (C: 1-5 with 1 lowest cost)	Priority (lowest number has	Responsible engineer	Target completion date	Detailed plan
	4	4*2*4=32	team leader and all members	11/01/2026	Redefine the project scope if necessary, and assign the tasks to other team members.
	2	4*4*2=32	Team Lead	Ongoing	Keep onboarding docs (setup guide, coding standards) current; assign an onboarding buddy.
	3	4*3*3=36	Team Lead	Ongoing	Track task status on the team board; team lead follows up early and reassigns if needed.
	2	3*4*2=24	Team Lead	Ongoing	Assign tasks explicitly on the sprint board; post a note in team chat before starting work.
	2	4*3*2=24	Architect / Lead Dev	Ongoing	Document acceptance criteria in the ticket before implementation starts; owner confirms scope first.
	2	4*4*2=32	Team Lead	Ongoing	Confirm each task against the current sprint backlog before starting.
	2	3*4*2=24	Lead Developer	Ongoing	Adopt a shared ESLint/Prettier config; require one peer review before merging.
	2	3*3*2=18	Requirements Engineer (rotating)	Ongoing	Require acceptance criteria on every story before it enters a sprint.
	2	3*3*2=18	Team Lead	Ongoing	Freeze scope at sprint start; log new requests to the backlog for a future iteration.

3	4*3*3=36	Team Lead / Req. Engineer	Ongoing	Version the requirements doc; approve changes only at iteration boundaries.
2	4*3*2=24	Team Lead	Ongoing	Match tasks to skills during sprint planning; check in mid-sprint on progress.
2	4*3*2=24	Team Lead	Ongoing	Break stories into small tasks; size sprints using prior iteration's actual velocity.
2	4*4*2=32	Current iteration's Team Lead	Ongoing	Use a repeatable process (standups, shared board, retros); outgoing lead hands off notes.
2	3*4*2=24	Most experienced dev on that layer	First 1-2 sprints	Pair unfamiliar members with an experienced teammate for their first tasks.
2	4*4*2=32	Team member's mentor	First 1-2 sprints	Assign smaller, well-scoped tasks first; use linting to catch mistakes early.
2	3*3*2=18	QA / Test Lead	Ongoing	QA lead shares a short testing how-to and one example suite in Sprint 1.
2	4*4*2=32	DevOps / Integration Lead	Ongoing	Run a quick team skills survey; allocate setup time in Sprint 1 for gaps found.
1	3*4*1=12	Team Lead	Ongoing	Agree on one branching strategy (feature branches + PRs); walk new members through it early so everyone's setup matches.
3	4*2*3=24	Architect	Reviewed each iteration	Review the data model/API design as a team before implementation starts each iteration.

3	4*3*3=36	Architect	Ongoing	Validate significant tech choices with a small spike before committing team-wide.
2	3*4*2=24	Lead Developer	Ongoing	Enforce linting and code review before merge; light refactor pass each iteration.
2	3*2*2=12	QA / Test Lead	Ongoing	Set a minimum coverage target for core workflows; include testing time in sprint planning.
3	3*2*3=18	DevOps / Integration Lead	Each sprint	Integrate and deploy continuously each iteration (CI pipeline + staging) rather than only at the end.

The team member who is adding the new feature should be the one who determines what is correct for the new functionality that was added.

Work together as a team to make sure each developer has the same environment. This is useful so that there aren't accidental bugs added due to environment issues.
